Planning evacuation routes

Safety in emergency situations

Planning evacuation routes is an essential measure for safety in the case of emergency situations such as fires, earthquakes or other disasters. A well-established plan helps people to leave a building quickly and safely, reducing the risk of panic and accidents.

What an evacuation route is

An evacuation route represents the safest and fastest way through which a person can leave a building in case of danger. It must be clear, accessible and free of obstacles.

In any home or building, it is important to have at least two evacuation routes, for situations in which one of them becomes inaccessible.

In moments of emergency, people may panic and lose precious time. For this reason, planning evacuation routes in advance is very important. Knowing the correct route allows for a quick and efficient reaction, reducing the risk of injury.

Example of a Romanian fire-safety information poster, showing the floor plan, evacuation arrows, prevention rules and emergency phone numbers.

How an evacuation plan is created

Creating an evacuation plan begins with identifying all the exits from the home or building. Clear routes must be established, leading outside while avoiding dangerous areas.

It is also important to set a meeting point outside the building, where all family members or occupants can gather after the evacuation. This helps with quickly checking that everyone is present.

Rules during evacuation

During the evacuation, it is essential to stay calm and act quickly. We must avoid using the lift and use the stairs instead. It is also important not to go back for personal belongings.

In the case of a fire, movement should be carried out crouched down, in order to avoid inhaling smoke. Doors must be opened carefully, checking whether they are hot, in order to avoid exposure to flames.

Practising the evacuation plan

An evacuation plan is only effective if it is known and practised. It is recommended that family members discuss and simulate the evacuation, in order to become familiar with the necessary steps.

Through simple exercises, the reaction in real situations becomes faster and safer.
